

Based on the provided system snapshot with psutil for Windows (Windows 11), there are several observations that may indicate issues or anomalies. Here are the top 2 critical problems based on the given data:

Problem 1: Disk Usage

- **C:**:

- Total disk usage: 53% of available space.
- Used space is higher than free space, indicating high utilization.

Action Needed: Monitor or clean up unnecessary files and temporary directories to reduce this percentage.

Problem 2: Network I/O

- **Net_IO**:

- Bytes Sent per Second (bps): 63.9 KB/s
- Packets Sent per Second (pps): 5841

This indicates a very slow network performance, which could be due to various reasons like poor network connectivity or overloading the system's network stack.

Actions Needed:

- **Disk Cleanup**:

Clean up files and temporary directories in C: to improve disk usage efficiency.

- **Network Optimization**:

Improve network conditions by ensuring proper connection settings or upgrade to a faster internet

connection if possible. Additionally, consider monitoring network traffic for any bottlenecks.

These two areas are likely the critical problems based on the provided data, as they directly impact system resources and performance.
