Based on the provided system snapshot using psutil on a Windows machine running Windows 11, here are the top 2 critical problems where we see abnormal observations:

1. **Disk Usage (G:\\)**:

   - The disk usage in the `G:\\` drive is unusually high at 55.3%, which exceeds 50%.

   - This indicates that this drive may be experiencing a significant amount of data stored, potentially requiring attention to free up space or optimize storage.

2. **Disk I/O (read_bytes and write_bytes)**:

   - The disk reads `read_count` is high at 9280353 operations with `read_bytes` being 371041765376 bytes.

   - This suggests that there might be frequent data reading activities or an issue related to disk I/O performance, possibly indicating slow access times or inefficient file handling.

These observations indicate potential inefficiencies and possible issues related to storage usage and disk throughput on the system.
